This is how I host my projects on my own domain for ₹0

No hosting bills. No cringe subdomains.

MOST STUDENTS DO THIS 👇

```
~~project-name.vercel.app~~
```

PROFESSIONALS DO THIS 👇

```
project-name.yourname.dev
```

> *Your domain is your digital surname. It's how people remember you.*

These are my live projects 👇

```
https://brolang.whyankush.wtf/
```

```
https://unidash.whyankush.wtf/
```

Hosted on my personal domain. For free.

Here's exactly how you do it ↓

STEP 0: Get GitHub Student Developer Pack
College email + ID proof = Free developer tools

↓

STEP 1: Claim free domain (.me, .tech, .wtf)
GitHub gives you 1 year free through Namecheap

↓

STEP 2: Point domain to Vercel
Change nameservers (it's easier than it sounds)

↓

STEP 3: Deploy via GitHub → Vercel
Push code. Import repo. Click deploy. Done.

One domain. Infinite projects.

Create subdomains for each project. Same identity, different products.

yourdomain.dev

`brolang.yourdomain.dev` | `unidash.yourdomain.dev` | `portfolio.yourdomain.dev`

> *Each project gets its own URL, but they all live under YOUR brand.*

The Real Setup (Quick Version)

→ **Vercel Dashboard:** Add your domain in project settings

→ **DNS Records:** Add A record pointing to Vercel's IP (76.76.21.21)

→ **CNAME for subdomains:** Points to cname.vercel-dns.com

→ **Wait 10 minutes:** DNS propagation (grab coffee)

→ **SSL Certificate:** Vercel handles this automatically (free HTTPS)

```
Type: A
Name: @
Value: 76.76.21.21

Type: CNAME
Name: brolang
Value: cname.vercel-dns.com
```

This isn't about hosting.

Recruiters remember domains.

project-name.vercel.app gets lost in the noise.

Clients trust ownership.

A personal domain signals professionalism.

You stop looking like a beginner.

Even if you are one. Perception matters.

Your domain is your digital surname.

I'll break down each step in detail next.

Save this. You'll need it.

Made by someone who believes students shouldn't pay for what they can get for free.
whyankush.wtf | No fluff. Just systems that work.
